

# Goals of a Data Warehouse

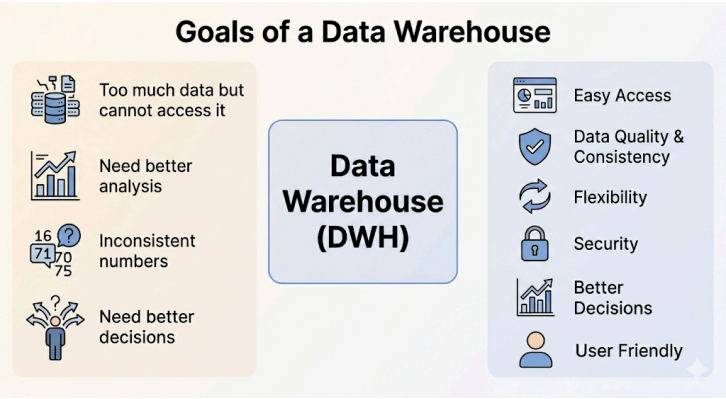

## Goals of a Data Warehouse

### Why do we need a Data Warehouse?

Organizations often say:

- “We have a lot of data, but we can’t access it.”
- “We want to analyze data in different ways.”
- “We need clear and consistent numbers.”
- “We want better decisions based on data.”

These problems define the goals of a Data Warehouse.

### 1. Make Data Easy to Access

- Data should be **simple and understandable** for business users (not بس developers).
- Users should easily **slice and dice** data (analyze it in different ways).
- Tools must be **easy and fast**.

### 2. Ensure Data Consistency & Quality

- Data must be:
  - **Clean, Accurate**
  - **Consistent across the company**
- Same metric name → must have the **same meaning**
- Different meanings → must have **different names**

### 3. Handle Change (Flexibility)

- Business needs always change.
- The DWH should:
  - Adapt easily
  - Add new data without breaking old systems
  - Keep historical data correct

### 4. Provide Security

- Protect sensitive business data
- Control who can access what

### 5. Support Better Decision Making

- Main goal = **help people make better decisions**
- Data Warehouse = **Decision Support System (DSS)**

### 6. Gain Business User Acceptance

- نجاح الـ DWH يعتمد على إن الناس تستخدمه
- لازم يكون:
  - Simple, Useful, Easy to use

**Publishing Metaphor: *Think of the Data Warehouse Manager like a magazine publisher***

What does this mean?

- **You don’t just store data**
- **You publish the right data**

## Responsibilities

- Understand users and their needs
- Choose the **most useful data**
- Make data **simple and clear**

- Ensure data is **accurate and trusted**
- Update data regularly
- Keep users satisfied

**Focus on users and business, not only technology**

- Technology = just a tool
- Real goal = **serve business users**
